

Multipole (E1, M1, E2, M2) transition wavelengths and rates between
states with $n \leq 6$ in heliumlike carbon, nitrogen, oxygen, neon,
silicon, and argon

Abstract

Transition wavelengths and rates are given for E1, E2, M1, and M2 transitions between singlet and triplet S , P , D , and F states in heliumlike ions of astrophysical interest: carbon, nitrogen, oxygen, neon, silicon, and argon. All possible transitions between states with $n \leq 6$ are considered. Wave functions and energies are calculated using the relativistic configuration-interaction (CI) method including both Coulomb and Breit interactions. For transitions to the ground state, the present theoretical wavelengths agree to five digits with precise measurements.

INTRODUCTION

In this paper, we present tables of energies and lifetimes of states of heliumlike ions with $n \leq 6$ and $L \leq 3$ for ions with Z from 6 to 18 obtained from relativistic configuration-interaction (CI) calculations. In addition, we present tables of electric dipole (E1), electric-quadrupole (E2), magnetic-dipole (M1), and magnetic-quadrupole (M2) wavelengths and transition rates.

In a recent paper [1], we gave wavelengths and transition rates for a limited set of E1 transitions in heliumlike ions. The aim of the present paper is to extend the calculations to give a more complete treatment of E1 transitions and to include forbidden E2, M1, and M2 transitions as well. In the most recent National Institute of Standards and Technology (NIST) data compilation by Wiese et al. [2], recommended transition rates for heliumlike C, N, and O are given for relatively few (23) forbidden transitions. By contrast, recommended values are given for hundreds of allowed E1 transitions. Among the forbidden transitions, the $1^1S_0 - 2^3S_1$ M1 transitions are the best studied, both theoretically [3, 4, 5, 6, 7] and experimentally [8, 9, 10, 11]. Relatively few results are available for M2 [6, 12, 13] and E2 [14] transitions.

We evaluate 2172 E1, E2, M1, and M2 matrix elements between states with $n \leq 6$ for C V; the corresponding numbers are 2178, 2190, 2224, 2265, and 2285 for N VI, O VII, Ne IX, Si XIII, and Ar XVII, respectively. The number of transitions is different for different ions since we ignored those transitions with energy differences less than 100 cm^{-1} .

METHOD

Wave Functions and Energies

The method used in the present calculation is described in detail in Plante et al. [6]. Briefly, relativistic CI calculations [15, 16] are used to obtain wave functions and energies. The wave function describing a state with angular momentum J, M in a two-electron ion is written as

$$\Psi_{JM} = \sum_{i \leq j} c_{ij} \Phi_{ij}(JM), \quad (1)$$

where the quantities c_{ij} are expansion coefficients and where the configuration state vectors $\Phi_{ij}(JM)$ are given, in second quantization, by

$$\Phi_{ij}(JM) = \eta_{ij} \sum_{m_i m_j} \langle j_i m_i, j_j m_j | JM \rangle a_i^\dagger a_j^\dagger | 0 \rangle, \quad (2)$$

with

$$\eta_{ij} = \begin{cases} 1, & i \neq j, \\ 1/\sqrt{2}, & i = j. \end{cases} \quad (3)$$

The quantities c_{ij} , $\Phi_{ij}(JM)$, and η_{ij} are independent of magnetic quantum numbers. To construct a state of even or odd parity, one requires the sum $l_i + l_j$ to be either even or odd, respectively. From the symmetry properties of the Clebsch-Gordan coefficients, it can be shown that

$$\Phi_{ij}(JM) = (-1)^{j_i + j_j + J + 1} \Phi_{ji}(JM). \quad (4)$$

This relation, in turn, implies that $\Phi_{ii}(JM)$ vanishes unless J is even. The wave-function normalization condition has the form

$$\langle \Psi_{JM} | \Psi_{JM} \rangle = \sum_{i \leq j} c_{ij}^2 = 1. \quad (5)$$

Substituting Ψ_{JM} into the Schrödinger equation $(H_0 + V)\Psi_{JM} = E\Psi_{JM}$, one obtains the following set of linear equations for the expansion coefficients c_{ij} :

$$(\epsilon_i + \epsilon_j)c_{ij} + \sum_{k \leq l} \eta_{ij} V(ij; kl) \eta_{kl} c_{kl} = E c_{ij}. \quad (6)$$

The potential matrix in Eq. (6) is

$$\begin{aligned} V(ij; kl) &= \sum_L (-1)^{j_j + j_k + L + J} \left\{ \begin{matrix} j_i & j_j & J \\ j_l & j_k & L \end{matrix} \right\} X_L(ijkl) \\ &+ \sum_L (-1)^{j_j + j_k + L} \left\{ \begin{matrix} j_i & j_j & J \\ j_k & j_l & L \end{matrix} \right\} X_L(ijlk), \end{aligned} \quad (7)$$

where the quantities $X_L(ijkl)$ are given by

$$X_L(ijkl) = (-1)^L \langle \kappa_i \| C_L \| \kappa_k \rangle \langle \kappa_j \| C_L \| \kappa_l \rangle R_L(ijkl). \quad (8)$$

The coefficients $\langle \kappa_i \| C_L \| \kappa_j \rangle$ in the above equation are reduced matrix elements of normalized spherical harmonics, and the quantities $R_L(ijkl)$ are relativistic Slater integrals defined in Refs. [15, 17]. In the present calculation, where both Coulomb and Breit interactions are included in the Hamiltonian,

$$X_L(ijkl) \rightarrow X_L(ijkl) + M_L(ijkl) + N_L(ijkl) + O_L(ijkl), \quad (9)$$

where $M_L(ijkl)$, $N_L(ijkl)$, and $O_L(ijkl)$ are the magnetic integrals defined in Ref. [18]. We solve the eigenvalue problem (6) to high accuracy using the methods described by Chen et al. [15]. For the high- n states considered herein, we closely follow the numerical procedures described in our previous work on E1 transitions [1].

Transition Amplitudes and Rates

Using the CI wave functions discussed above for both the initial and final states and carrying out the sums over magnetic substates, one obtains the following expression for the reduced K -pole matrix element for transitions between two states $vw(J)$ and $v'w'(J')$ [6]:

$$\begin{aligned} Z_K[v_1w_1(J) - v_2w_2(J')] &= \sqrt{[J][J']} \sum_{vw} \sum_{v'w'} \mathcal{S}^J(v_1w_1, vw) \mathcal{S}^{J'}(v_2w_2, v'w') \\ &\quad \times (-1)^{K+j_w+j_{v'}} \left\{ \begin{matrix} J & J' & K \\ j_{v'} & j_w & j_v \end{matrix} \right\} Z_K(v'w) \delta_{vw'}, \end{aligned} \quad (10)$$

where $[J] = 2J + 1$. The quantity $\mathcal{S}^J(v_1w_1, vw)$ is a symmetry coefficient defined by

$$\mathcal{S}^J(v_1w_1, vw) = \eta_{v_1w_1} [\delta_{v_1v} \delta_{w_1w} + (-1)^{j_v+j_w+J+1} \delta_{v_1w} \delta_{w_1v}]. \quad (11)$$

We consider here E1 and E2 matrix elements in length and velocity forms as well as M1 and M2 matrix elements. The E1 one-electron reduced matrix elements $Z_1(vw)$ are given by Eqs. (11–12) in Johnson et al. [1]. The retarded E2, M1, and M2 matrix elements are given by:

E2 length

$$\begin{aligned} Z_2(vw) &= \langle \kappa_v \| C_2 \| \kappa_w \rangle \frac{15}{k^2} \int_0^\infty dr \left\{ j_2(kr) [G_v(r)G_w(r) + F_v(r)F_w(r)] \right. \\ &\quad \left. + j_3(kr) \left[\frac{\kappa_v - \kappa_w}{3} [G_v(r)F_w(r) + F_v(r)G_w(r)] + [G_v(r)F_w(r) - F_v(r)G_w(r)] \right] \right\}, \end{aligned} \quad (12)$$

E2 velocity

$$\begin{aligned} Z_2(vw) &= \langle \kappa_v \| C_2 \| \kappa_w \rangle \frac{15}{k^2} \int_0^\infty dr \left\{ 2 \frac{j_2(kr)}{kr} [G_v(r)F_w(r) - F_v(r)G_w(r)] \right. \\ &\quad \left. - \frac{\kappa_v - \kappa_w}{3} \left[-j_3(kr) + \frac{3}{kr} j_2(kr) \right] [G_v(r)F_w(r) + F_v(r)G_w(r)] \right\}, \end{aligned} \quad (13)$$

M1

$$Z_1(vw) = \langle -\kappa_v \| C_1 \| \kappa_w \rangle \frac{6}{\alpha k} \int_0^\infty dr \frac{(\kappa_v + \kappa_w)}{2} j_1(kr) [G_v(r)F_w(r) + F_v(r)G_w(r)], \quad (14)$$

M2

$$Z_2(vw) = \langle -\kappa_v \| C_2 \| \kappa_w \rangle \frac{30}{\alpha(k)^2} \int_0^\infty dr \frac{(\kappa_v + \kappa_w)}{3} j_2(kr) [G_v(r)F_w(r) + F_v(r)G_w(r)]. \quad (15)$$

In the above equations, κ_v is the angular momentum quantum number [$\kappa_v = \mp(j_v + \frac{1}{2})$ for $j_v = (l_v \pm \frac{1}{2})$], and $k = \omega\alpha$, where $\omega = \varepsilon_w - \varepsilon_v$ is the photon energy and α is the fine-structure constant. The quantity $\tilde{C}_{1q}(\hat{r})$ is a normalized spherical harmonic and $j_l(kr)$ is a spherical Bessel function of order l . The functions $G_a(r)$ and $F_a(r)$ are large- and small-component radial Dirac wave functions, respectively.

The E1, E2, M1, and M2 transition probabilities A_{FI} (s^{-1}) are obtained in terms of line strengths S_{FI} (a.u.) and wavelength λ (Å) as

$$A_{FI}^{E1} = \frac{2.02613 \times 10^{18}}{[J_I] \lambda^3} S_{FI}^{E1}, \quad (16)$$

$$A_{FI}^{E2} = \frac{1.11995 \times 10^{18}}{[J_I] \lambda^5} S_{FI}^{E2}, \quad (17)$$

$$A_{FI}^{M1} = \frac{2.69735 \times 10^{13}}{[J_I] \lambda^3} S_{FI}^{M1}, \quad (18)$$

$$A_{FI}^{M2} = \frac{1.49097 \times 10^{13}}{[J_I] \lambda^5} S_{FI}^{M2}. \quad (19)$$

COMPARISON AND DISCUSSION

In Table A, we compare our results for wavelengths λ , line strengths S , and transition rates A for M1, M2, and E2 transitions for He-like C, N, and O with the data for these transitions listed in Wiese et al. [2]. Our theoretical wavelengths are in excellent agreement with the precise experimental wavelengths given in [2]; the differences range from 0.0007% to 0.005%. An exception is the $2^3P_2 - 1^1S_0$ transition in O VII, where the difference is 0.02%. The best agreement for forbidden transition rates ($\leq 3\%$) occurs for M2 transitions; differences for M1 transitions range from 0.03% to 25%; and the worst agreement (2% – 50%) occurs for E2 transitions. In this regard, it should be noted that NIST data for E2 transitions are based on theoretical results published more than 20 years ago [14].

We also find excellent agreement (0.1% – 0.2 %) for $2^3S_1 - 1^1S_0$ M1 and $2^3P_2 - 1^1S_0$ M2 transition rates with results obtained from relativistic many-body theory in [6].

To check our results for transitions from higher n states, we made a number of second-order RMBPT calculations for M1, M2, and E2 transitions between $n_5 = 3$ and $n = 1, 2$ states in O IX and Si XIII. We found

that differences between the two sets of calculations decreased with increasing Z , as expected. Differences for E2 transitions with $\Delta S = 0$ were about 1% - 5% for O VII and 0.01% - 1% for Si XIII. For E2 intercombination transitions $\Delta S \neq 0$, differences increased by factor 10, primarily because of strong cancellations leading to inaccuracies in the RMBPT calculations. For the $3^3S_1 - 2^3S_1$ and $3^3S_1 - 2^3S_1$ M1 transitions we found much larger differences with RMBPT owing to negative energy state (NES) contributions, which are omitted in the present calculations but are included in the comparison RMBPT calculations. Those effects are expected to be large for nonrelativistically forbidden ($n_f \neq n_i$) M1 transitions that conserve total spin according to the analysis given in Ref. [7]. We therefore expect poor accuracy ($\approx 10\%$) for the rates of all such transitions. For other M1 transitions, which change spin or do not change n , the accuracy is much better (1% - 2%).

RESULTS

In Tables I - VI, we present our wavelengths λ and transition rates A . Empty spaces in the tables signify that no transition is possible. Level designations are given in four columns: the first two columns on the left are for E1 and M2 transitions (even-odd or odd-even) and the next two columns with level designations are for E2 and M1 transitions (without change of parity). Tables are organized in order of increasing n of the upper level, with singlet states first followed by triplet states; they are further ordered by orbital quantum number L . All transitions from a fixed upper level into lower levels are included except levels where the transition energy is smaller than 100 cm^{-1} .

In Table VII, we list the sum of the transition rates A taken from Tables I - VI. Data are given separately for each type of transitions (E1, E2, M1, M2) together with the sum of all transitions. The last column of Table VII lists lifetimes (ps) and the second column presents energies (cm^{-1}) relative to the ground state. Results for the 57 possible $n^{1,3}L_J$ levels with $n = 2$ to 6, $L = 0$ to 4, and $J = 0$ to 3 are included for the C V, N VI, O VII, Ne IX, Si XIII, and Ar XVII. As can be seen, lifetimes in heliumlike ions are almost always dominated by E1 transitions. It should be noted that only single-photon contributions to decay rates are included. Therefore, rates reported in Table VII for 2^3S_0 states, which dominantly decay by emission of two photons, are underestimated by many orders of magnitude and should be replaced by accurate two-photon rates given, for example, in Ref. [19].

CONCLUSION

We have presented a systematic relativistic CI study of wavelengths and transition rates between states with $n \leq 6$ in He-like ions with $Z = 6, 7, 8, 10, 14$, and 18. All possible E1, E2, M1, and M2 transitions are considered. Length and velocity form matrix elements for E1 and E2 matrix elements are in close agreement; the very small differences between these forms can be explained by omitted negative-energy state contributions. The accuracy of our energy values is about 0.007% - 0.025%.

Wavelengths λ (Å) and radiative transition rates A (s^{-1}) for transitions from $n^{1,3}L_J$ upper level to all $n'^{1,3}L'_J$ lower levels in He-like silicon.

TABLE VI:

Wavelengths λ (Å) and radiative transition rates A (s^{-1}) for transitions from $n^{1,3}L_J$ upper level to all $n'^{1,3}L'_J$ lower levels in He-like argon.

The following notation is used: $n^{1,3}L_J \equiv (1snl)^{1,3}L_J$ and we use $a[b]=a10^b$ to represent powers of ten.

In the first two columns and the sixth and seventh columns, we give the state designations $n^{1,3}L_J$ and $n'^{1,3}L'_J$ for upper and lower levels, respectively.

The rows contain wavelengths in Å and transition rates in s^{-1} for E1 and M2 transitions followed by wavelengths in Å and transition rates in s^{-1} for E2 and M1 transitions. Empty spaces signify that the corresponding transitions do not occur.

TABLE VII:

Energies E (cm^{-1}), total radiative E1, E2, M1, and M2 transition rates A (s^{-1}) and lifetimes τ (10^{-12} s) for $n^{1,3}L_J$ levels in C V, N VI, O VII, Ne IX, Si XIII, and Ar XVII.

In the first column we give the state designations $n^{1,3}L_J$.

The following notation is used: $n^{1,3}L_J \equiv (1snl)^{1,3}L_J$ and we use $a[b]=a10^b$ to represent powers of ten.

The rows contain energies in cm^{-1} , radiative E1, E2, M1, M2 rates, total (E1+E2+M1+M2) rates A (s^{-1}), and lifetimes τ in 10^{-12} .

Table I: Wavelengths λ (Å) and radiative transition rates A (s^{-1}) for transitions from $n \ ^1,^3L_J$ upper level to all $n' \ ^1,^3L'_{J'}$ lower levels in He-like carbon. Numbers in brackets represent powers of 10.

Table V: Wavelengths λ (Å) and radiative transition rates A (s^{-1}) for transitions from $n^{1,3}L_J$ upper level to all $n'^{1,3}L'_{J'}$ lower levels in He-like silicon. Numbers in brackets represent powers of 10.

Upper	Lower	λ (Å)	A^{E1} (s^{-1})	A^{M2} (s^{-1})	Upper	Lower	λ (Å)	A^{E2} (s^{-1})	A^{M1} (s^{-1})
